

Forms

① $\frac{1}{4}(8x + 4y - 16z)$

② $2x + y - 4z$

Are ① and ② the same?

Yes

① $\frac{1}{4}(8x + 4y - 16z)$

$\hookrightarrow 2x + y - 4z$

Distributive property:

$\underline{a} \cdot (\underline{b} + \underline{c}) = a \cdot b + a \cdot c$

FOIL

$(a + b)(x + y) = (a + b) \cdot x$

$$\underbrace{(a+b)}_a (\underline{x+y}) = (a+b)x + (a+b)y$$

$$ax + bx + ay + by$$

$$\begin{aligned} (x+2)(x-3) &= x^2 + -3x \\ &\quad + 2x + -6 \\ &= x^2 - 1x - 6 \end{aligned}$$

$$\begin{aligned} x + x &= 2x \\ x \cdot x &= x^2 \end{aligned}$$

Expand

$$(x+3)(x-3) = x^2 + -3x + 3x - 9$$

$$= \underline{\underline{x^2 - 9}}$$

$$(\underline{x} + y + z) (\underline{x} + \underline{3})$$

③ ②

$$x^2 + 3x + xy + 3y + xz + \underline{3z}$$

6 terms

Practice:

$$(\underline{x} + \underline{1})(\underline{x} + \underline{2}) = x^2 + \underline{3x} + \underline{2}$$

$$(x + 3)(x + \underline{4}) = x^2 + \underline{7x} + \underline{12}$$

$$(x + \underline{4})(x + \underline{6}) = x^2 + \underline{10x} + \underline{24}$$

$$(x-5)(x+7) = x^2 + 2x - 35$$

$$-2(x+3)(x+2)$$

$$\textcircled{1} (-2x-6)(x+2)$$

$$\hookrightarrow -2xx - 4x - 6x - 12$$

$$-2x^2 - 10x - 12$$

$\textcircled{2}$ FOIL first

$$-2[x^2 + 2x + 3x + 6]$$

$$-2x^2 - 4x - 6x - 12$$

$$-2x^2 - 10x - 12$$

$$-(x - x^2 + 2) = -1 \cdot (x - x^2 + 2)$$

$$= -x + x^2 - 2$$

a, b are any #'s

$$(x+a)(x+b) = x^2 + ax + bx + ab$$

$$(x+a)(x+b) = x^2 + ax + bx + ab$$

$$x^2 + (a+b)x + a \cdot b$$

$$(1x + 30)(1x - 5)$$

$$= x^2 + 25x + -150$$

$$b = -a$$

$$(1x + a)(1x - a) =$$

$$x^2 + \cancel{ax} - \cancel{ax} - a^2$$

$$(x+3)(x-3) = x^2 - 9$$

$$(x+5)(x-5) = x^2 - 25$$

$$(x-9)(x+9) = x^2 - 81$$

$$(x+5)(x-5) = x^2 - 25$$

Q: to think about:

what is

$$(100,011) \times (99,989)$$
