

11/10/2023 :

• Normal distribution

• Z-scores

$$Z_x = \frac{x - \mu}{\sigma}$$

not necessarily
normal

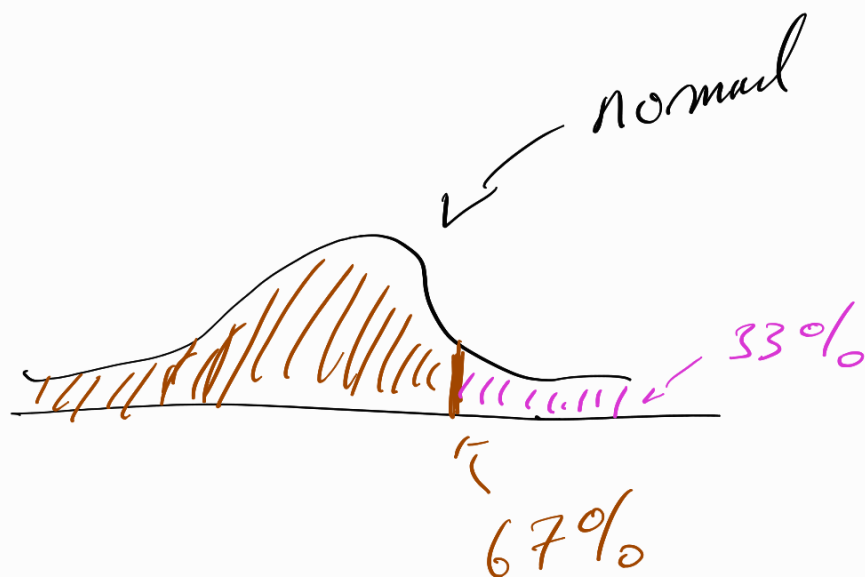

← spits a #

z-score table

percentile

• you just need μ
and σ

↑ if X is normal
distribution
↓
Probability

Example. We create light bulbs

- avg lifespan 1500 hrs
- std dev 75 hrs
- lifespan is normally dist

Q: Prob \uparrow light bulb has lifespan
between 1400 hrs

randomly selected

1400 hrs
1600 hrs ?

$$\frac{1400 - 1500}{75} = -1.25 \rightarrow 10.56\%$$

$$\frac{1600 - 1500}{75} = 1.25 \rightarrow 89.43\%$$

$$\text{Answer: prob} = \frac{89.43}{-10.56} = 78.87\%$$

Example \rightarrow 20% fails final.
Final avg score 62
std dev = 13

How many pts on final are needed to pass?

$$Z = -0.84$$

$$\hookrightarrow \frac{x - 62}{13} = -0.84$$

$$x = 51.08$$

Must get
51.08 pts

X is normal

• 18% of values are above 29.

• $\mu = 25$

what's σ ?

$$0.92 = \frac{29 - 25}{\sigma}$$

$$\sigma = 4.347$$

X is binomial (discrete)

↳ able to approx w/ its normal dist.

(gives probability)

if

①

$$np \geq 10$$

②

$$n(1-p) \geq 10$$

$\begin{cases} n = \# \text{ of trials} \\ p = \text{Prob of success} \end{cases}$
